

GENERATION PGM

News Brief

Looking for Fisheries Enhancement and Restoration Ideas

The proposed Marathon Palladium Copper Project will result in the loss of fish habitat due to overprinting by the open pits, tailings facility, mine rock stockpile and other project infrastructure.

As part of our commitment to protecting the environment and as required by federal government regulations, Generation PGM will be investing in fish habitat creation and habitat improvements in the area.

We are actively looking for input from local land users and residents to help us select projects and opportunities that will improve fish and fishing in the area.

Do you have knowledge of a creek, lake, or pond that could use some improvements due to natural or man-made habitat limitations? This could include degraded habitat or barriers to fish movement. Do you have a fish research or restoration project that is in need of support? Please let us know!

Reach out to us at comments@genpgm.com and let us know your thoughts and ideas about how to improve fish habitat in the regional area.

Thank you so much for your interest, we look forward to hearing from you!
